

Installation for p/n 5928 - 360° photocontrol receptacle kit

The hole size that we use is 2.125 inches

The receptacle and rubber gasket are mounted on top of the fixture
the round metal bracket on the inside of the fixture
The screws go through all components and tighten everything against the fixture.
How the swivel works - since the hole is larger than normally used for a receptacle - the mounting screws for the receptacle actually sit inside the hole.
Loosen the screws and you can rotate the complete assembly.
